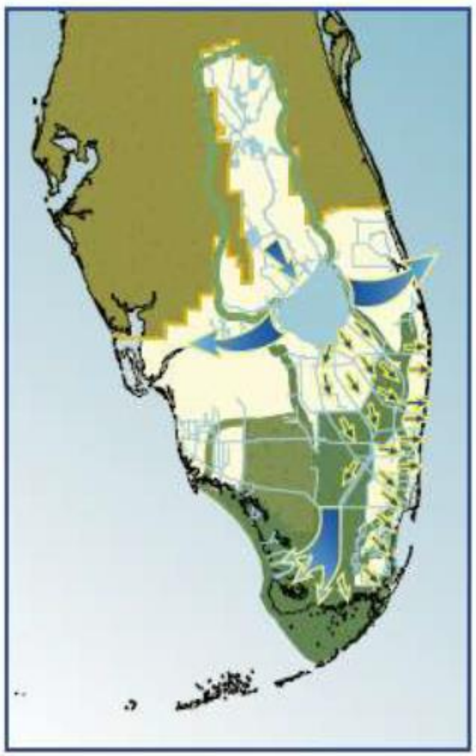
Restoration

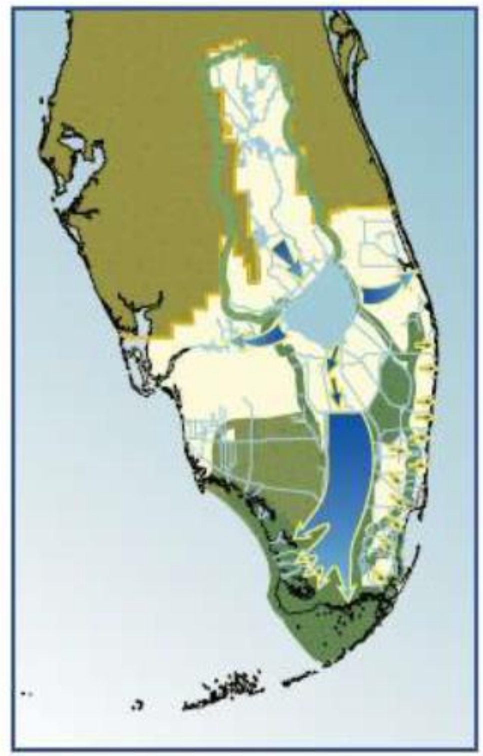
Everglades restoration will enable the right quantity of water, at the right quality, to be distributed to the right place, at the right time throughout south Florida.

This will be accomplished through the implementation of multiple projects that will work together to provide:

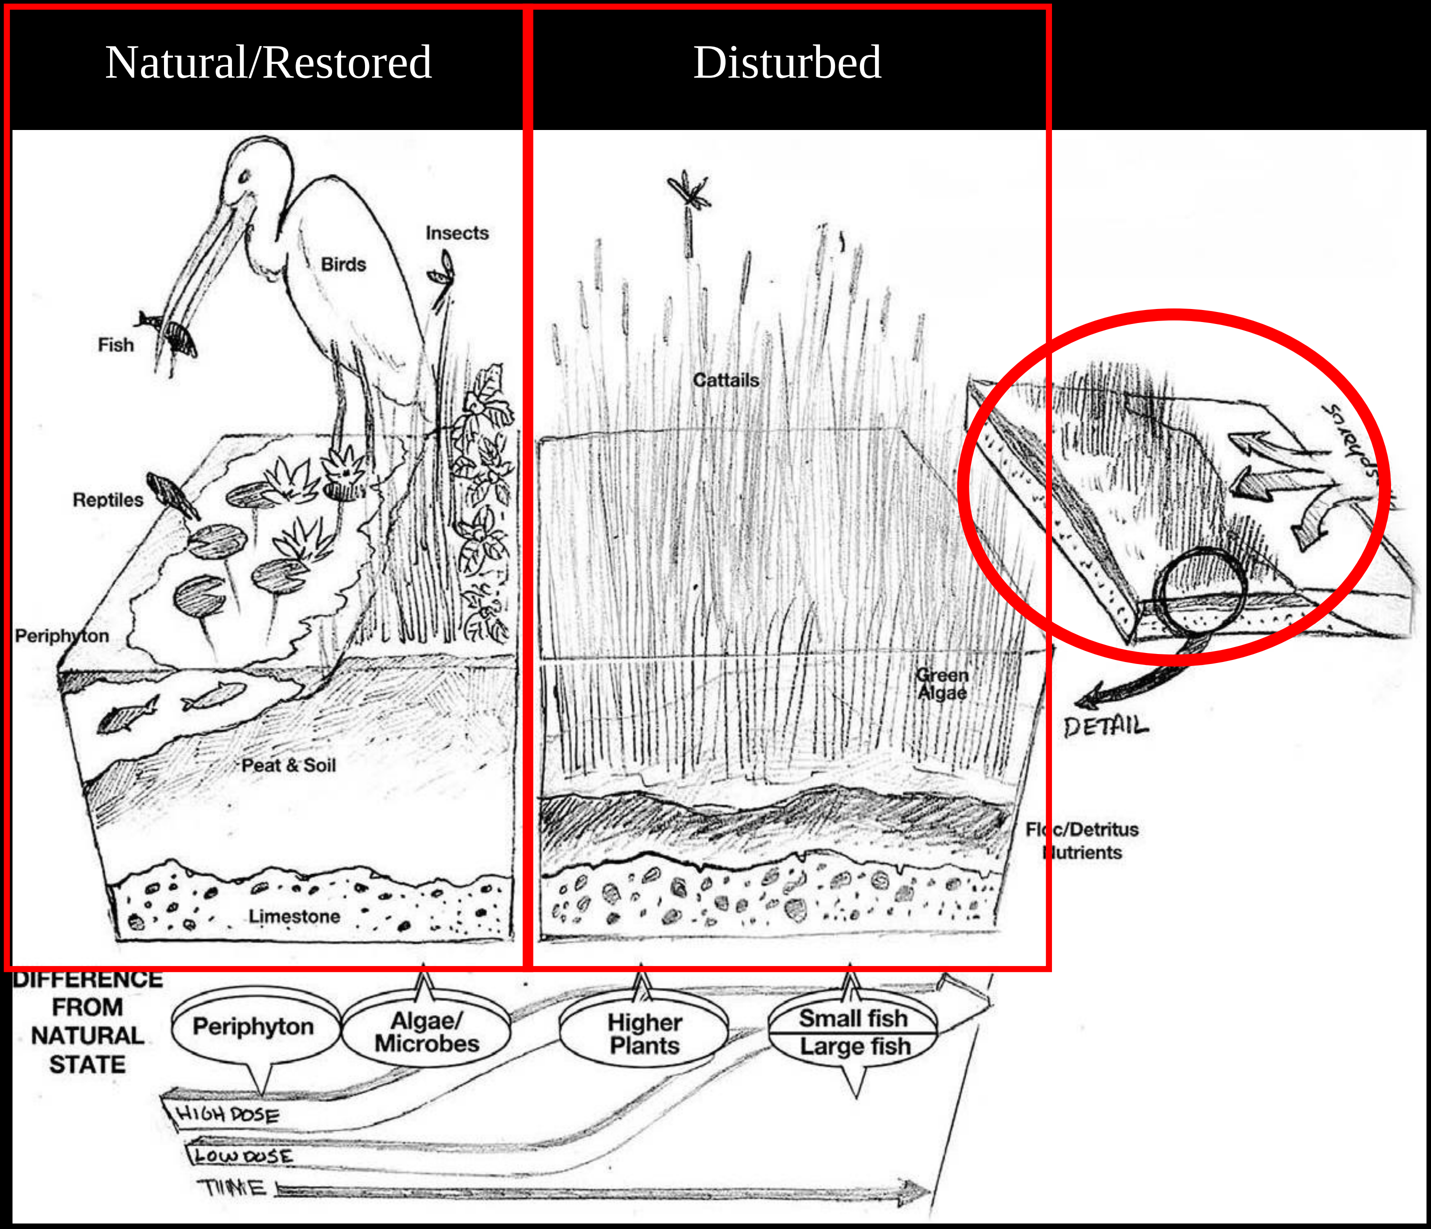
- Water Storage
- Water Treatment
- Water Conveyance
- Water Distribution



Current Flow



Restored Flow



Borkhataria et al (2017) The Synthesis of Everglades Restoration and Ecosystem Services (SERES): a case study for interactive knowledge exchange to guide Everglades restoration. Restoration Ecology 25:S18–S26.

Ecosystem assessment - Soils

- Soils are an integrator of long-term water chemistry conditions
- Nutrient inputs to wetlands primarily stored in soils
- Spatial distribution of soil nutrients can be used to assess long-term nutrient impacts
- Soils = ideal ecosystem component for assessing baseline condition

Eutrophication Metric
Vegetation

	1995 - ha	2004 - ha	Diff - ha
Total Cattail	19,870.50	32,349.00	12,478.50
Other	214,983.25	202,504.75	-12,478.50
Total	234,853.75	234,853.75	0.00

- Cattails (*Typa spp.*) are used as indicator species of eutrophication and disturbance.
- Respond to changes in water quality.
- … and hydrology.

Objective

- Evaluate soil nutrient and water quality changes in upper Taylor Slough during hydrologic restoration.

Hypotheses

- Soil nutrient concentrations will decrease due to hydrologic restoration.
- Water quality conditions will improve due to improved hydrology.

Pre 1994

- L-31W canal was constructed (1961 -1968).
- L-31W canal operated for water supply to Taylor Slough via gravity flow (1969-1980).
- S-332 pump stations installed South-Dade Conveyance System operation commenced (1981-1991).

1994

Increase in S-332 discharge capacity

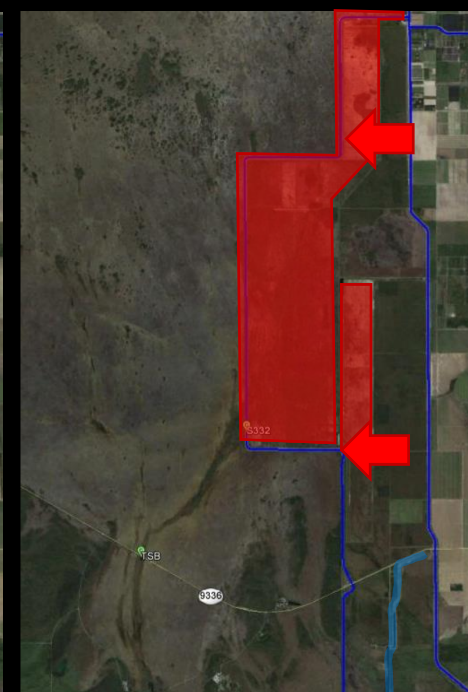
2001/2002

S-332 stopped ops. D- Detention basin constructed

2014

Improved Conveyance and storage

2016



Canal plugging and structure construction and ops.

Solid points: >6 Samples Per Year (samples in wet and dry season)
Empty Points: <6 Samples Per Year (unequal samples between seasons).

Julian, *Unpublished Data*

Year	Aerial Imagery Coverage
1994	No cattail detected
1999	No cattail detected
2004	~ 8.1 ha
2007	~ 5.7 ha (field data)
2009	~ 7.9 ha

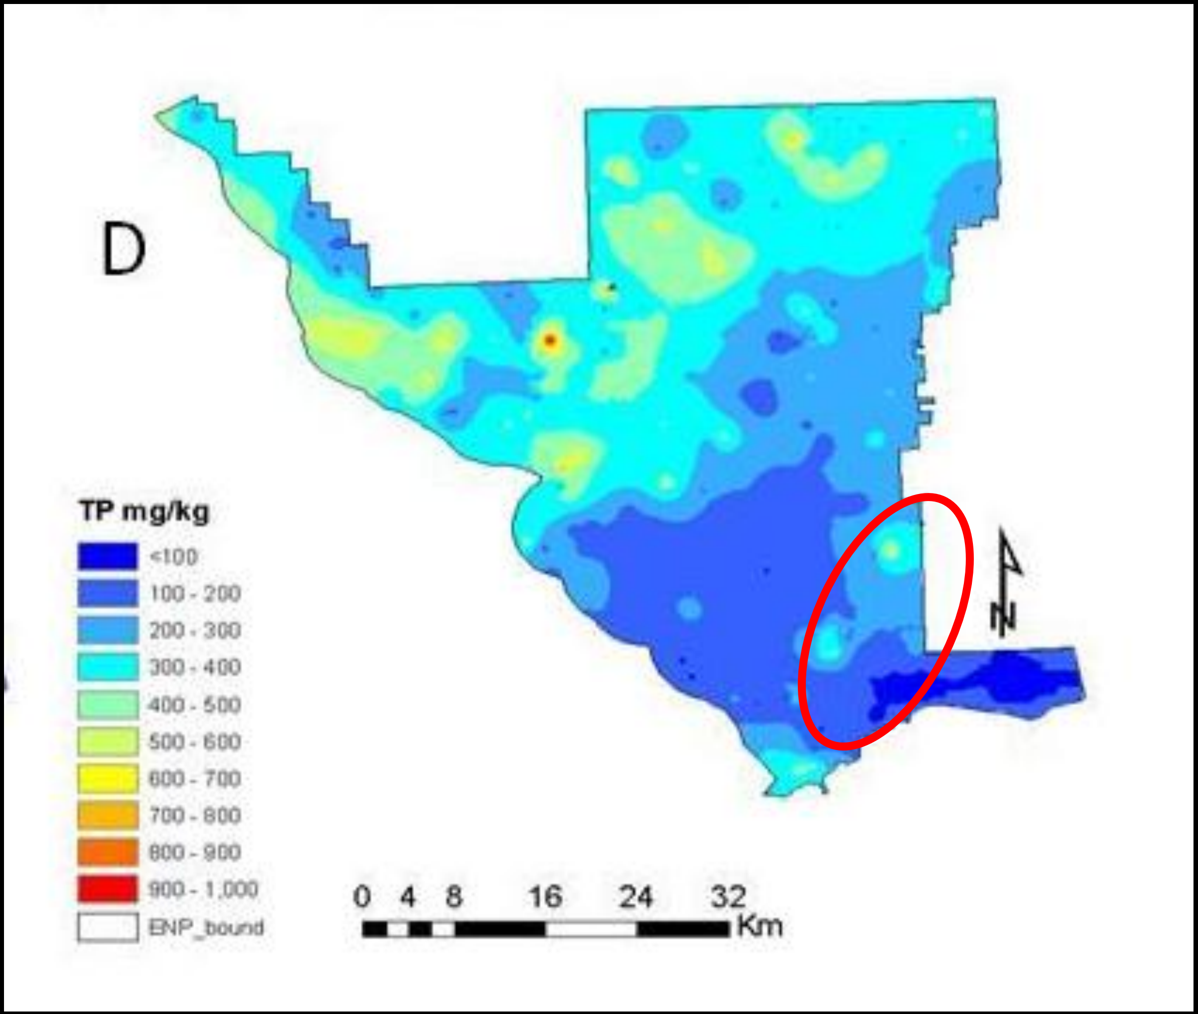
2003



Soil TP (mg kg^{-1}) Everglades National Park

Statistic	Value
Mean	362
Min	54
Max	628
SD	87
N	310
>500 mg kg^{-1}	7%

Osborne et al (2011) Spatial distributions and eco-partitioning of soil biogeochemical properties in the Everglades National Park. Environmental Monitoring and Assessment 183:395–408.

- Numerous regional monitoring efforts did not detect eutrophication and cattail occurrence in UTS.
- First cattail observation in UTS approx. 2004
- Surface water TP concentrations in UTS are relatively low.
    - Inflow annual FWM < 10 $\mu g\ L^{-1}$ for the last 15 years
    - Downstream marsh (i.e. TSB and TS/Ph2) < 10 $\mu g\ L^{-1}$
